CH08-320142

Programming in C++ I

C++I

Lecture 1 & 2

Dr. Kinga Lipskoch

Fall 2018

Who am I?

Organization

- ► PhD in Computer Science at the Carl von Ossietzky University of Oldenburg
- ▶ University lecturer at the Department of Computer Science
- ▶ Joined Jacobs University in January 2013
- ▶ Office: Research I. Room 94
- ► Telephone: +49 421 200-3148
- ► E-Mail: k.lipskoch@jacobs-university.de
- ▶ Office hours: Mondays 10:00 12:00

C++ I Fall 2018 2 / 85

Course Goals

- ► Learn the basic aspects of object-oriented programming
- ▶ Learn the basic details of the C++ programming language
- Write and test simple programs
- ► "Hands on": not just theory, but practice lab sessions to apply what you have learned in the lectures

C++ I Fall 2018 3/85

Course Details

Organization

- \triangleright 3 weeks = 24 hours
- ► Every week will consist of
 - ▶ 2 lectures: Thu/Fri afternoon, 14:15 16:15
 - ▶ 2 lab sessions: Thu/Fri afternoon, 16:15 18:30
- ▶ During each lab session you will have to solve a programming assignment sheet (consisting of multiple exercises) related to the corresponding lecture

C++ I Fall 2018 4/85

Course Resources

Textbooks:

Organization

- ► Frank B. Brokken, C++ Annotations Version 10.8.1 http://www.icce.rug.nl/documents/cplusplus/
- ▶ Bruce Eckel: Thinking in C++, Volume I: Introduction to Standard C++, Second Edition, 2000, Prentice Hall PTR

Slides, program assignments, and code will be posted on Grader

- ► https://grader.eecs.jacobs-university.de/courses/ 320142/2018_2r3/
- ► https://grader.eecs.jacobs-university.de/courses/ 320142/2018_2r4/

Classes

C++ I Fall 2018 5 / 85

Grading Policy

- ▶ 35% average grade of the assignments
- ▶ 65% grade of the final exam
- ► In the (written) final exam you will be asked to solve exercises similar to ones in the assignments
- ▶ The final exam will take place at the end of the semester

C++ I Fall 2018 6 / 85

Programming Assignments

Organization

- ► There will be presence assignments that need to be solved in the lab
- ► Other assignments are due on the following Tuesday and Wednesday morning at 10:00 h
- ► These assignments are structured in a way that you can solve them during the lab session
- ► Solutions have to be submitted via web interface to https://grader.eecs.jacobs-university.de
- Assignments are graded by the TAs

C++ I Fall 2018 7/85

Organization

- ▶ You can access Grader from campus without any additional connection or software
- To access Grader from outside of campus you need to use a VPN (Virtual Private Network) connection
- ▶ Tutorials from the Jacobs IRC IT team on how to install a VPN client.

https://www.youtube.com/user/jacobsircit

C++IFall 2018 8 / 85

Grading Criteria for Assignments

- ► Grading criteria
 https://grader.eecs.jacobs-university.de/courses/
 320142/2018_2r2/Grading-Criteria-C++.pdf
- Weekly tutorials given by the TAs to help
- Grand tutorial a few days before the exam

C++ I Fall 2018 9 / 85

Lab Sessions

- ► TAs will be available to help you in case of problems
- ▶ Optimize your time: solve the assignments during lab sessions
- ➤ Do not copy the solutions for the assignments, it is not only illegal, but you will certainly fail the written final exam without practice in programming

C++ I Fall 2018 10 / 85

Missing Homework, Quizzes, Exams according to AP

- https://www.jacobs-university.de/sites/default/files/bachelor_policies_v1.1.pdf (page 9)
- ▶ Illness must be documented with a sick certificate

Organization

- Sick certificates and documentation for personal emergencies must be submitted to the Student Records Office by the third calendar day
- Predated or backdated sick certificates will be accepted only when the visit to the physician precedes or follows the period of illness by no more than one calendar day
- Students must inform the Instructor of Record before the beginning of the examination or class/lab session that they will not be able to attend
- ► The day after the excuse ends, students must contact the Instructor of Record in order to clarify the make-up procedure
- Make-up examinations have to be taken and incomplete coursework has to be submitted by no later than the deadline for submitting incomplete coursework as published in the Academic Calendar

C++ I Fall 2018 11 / 85

Syllabus of the Course

- ► Introduction to objects and classes
- Overloading and references
- ► Constructors, destructors, passing objects
- Copy constructors
- Dynamic object creation
- ► Conditional compilation, namespaces, inline functions
- Static members
- Inheritance
- ► Function and operator overloading
- Polymorphism

C++ I Fall 2018 12 / 85

Programming Environment (1)

- ► C++ is available on practically every operating system
- Commercial
 - ▶ Microsoft C++, Intel C++, Portland
- ► As well as free compilers available
 - ▶ g++
- g++ available on many platforms
- ▶ g++ 6.3.0 is used on Grader

C++I

Organization

Programming Environment (2)

Organization

- ► We will refer to the Unix operating system and related GNU tools (g++, gdb, some editor, IDE, etc.)
- ▶ Install a C++ compiler on your notebook
- ▶ IDE (Integrated Development Environment) may be helpful
- ► Code::Blocks http://codeblocks.org/
- ► CodeLite http://www.codelite.org/
 - powerful IDEs
 - run on Linux, Mac, Windows

C++ I Fall 2018 14 / 85

Programming Environment (3)

► Linux

Organization

- preferred environment
- prepare to get to know Unix/Linux
- ▶ g++ should be already on your machine
- ▶ you can install CodeLite from https://downloads.codelite.org/
 - any other IDE or editor is also fine

Programming Environment (4)

Mac OS

Organization

- ► it is a Unix system as well
- XCode (is on MacOS DVD)
- ▶ if the DVD is not available you might need to register as Apple Developer to be able to download XCode
- ► CodeLite http://downloads.codelite.org/

C++ I Fall 2018 16 / 85

Programming Environment (5)

Windows

Organization

- ► CodeLite includes a C++ compiler http://downloads.codelite.org/
- choose: CodeLite Installer 12.0 for Windows
- download and install it
- includes gdb and g++
- ▶ Alternatives: Visual C++ Express (free of charge), Eclipse, **NetBeans**

C++IFall 2018 17 / 85

Programming Environment (6)

Organization

- ➤ You will upload your solutions to Grader, where your source code will be automatically compiled
- ▶ Your programs must compile without any warning with g++
- ► On your local machine turn on all warnings: g++ -Wall -o file file.cpp

C++ I Fall 2018 18 / 85

Organization

- ▶ What is C++?
- What is object-oriented programming?
- Differences to C
- Function overloading
- Inline functions
- Strings
- Introduction to objects and classes
- Information hiding
- ▶ The interface of an object (data members and methods)

Classes

Organization

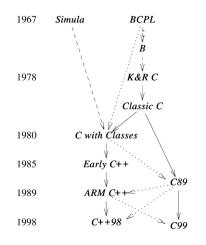

- ▶ 1970's B. Kernighan and D. Ritchie create C language at Bell Labs
- ▶ 1980's Bjarne Stroustrup creates C successor
 - C with classes
 - ▶ Using some pre-compiler C++ code was translated into C and compiled then
- ▶ 1998 C++ finally becomes ISO standard (ISO/IEC 14882:1999)
- ▶ 2003 C++03 (ISO/IEC 14882:2003)
- ▶ 2005 Technical Report (TR1) (many extensions)
- ▶ 2011 C++11 (ISO/IEC 14882:2011)
- ▶ 2014 C++14 (ISO/IEC 14882:2014(E))
- ▶ 2017 C++17 (final standard published in December)

C++ I Fall 2018 20 / 85

The Way to C++

Organization

- Simula has been developed in the 1960s at the Norwegian Computing Center in Oslo, by Ole-Johan Dahl and Kristen Nygaard
- Based on ALGOL 60 it is considered to be the first object-oriented programming language
- Here ARM is not the now more and more famous processor, but Bjarne Stroustrup's ARM (Annotated Reference Manual) which was the de-facto standard, since no official standard existed

Classes

C++ I Fall 2018 21 / 85

Organization

C is almost a complete subset of C++

- possibility to clean up some things, but
- compatibility to millions lines of code considered more important
- some differences remain
- char constants:
 - ▶ 1 byte in C++ (actually char)
 - 4 bytes in C (actually an int)
- ▶ older C++ standards required prototypes (from standard C11 no implicit need for prototypes)

C++ I Fall 2018 22 / 85

C++ and OOP

Organization

- ► C++ is an improved version of C, which includes constructs supporting Object-Oriented Programming (OOP)
 - Improved version of C means that
 - Almost all the code written in C will be compiled by a C++ compiler
 - ► C++ fixes some C "holes"
 - ▶ This may need minor code adjustments
 - ▶ Libraries written for C can be used for C++
 - The meaning of C constructs is not altered
- ► C++ is a multi-paradigm language
- ▶ It does not force you to exclusively use OOP, but it lets you mix OOP and classic imperative programming (differently from other pure OO languages like Java, Smalltalk, etc.)

C++ I Fall 2018 23 / 85

What is OOP?

Organization

- ► OOP is a programming paradigm, i.e., a way to organize the solution of your computational needs
 - But definitely not the only way
- Pros and cons
 - Increases productivity at very different levels (code reuse, generic programming, hopefully simpler design process)
 - ▶ OOP is not the solution for every need
 - ► OOP could be not easy to learn and takes a long time before one can master it properly

Imperative Programming vs. OOP (1)

Organization

Imperative programming relies on a top-down approach

- ► Iteratively divide the given problems into simpler sub-problems (simpler from a logic point of view)
- ▶ When a sub-problem is simple enough, code it
 - Again, simple means simple from a logic point of view, and not from the point of view of the number of lines of code
- Interactions between sub-problems happen by mean of function calls
 - You have seen this while programming in C

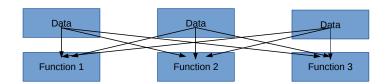

C++ I Fall 2018 25 / 85

Problems with Imperative Programming using Functions

▶ account.c

Organization

- Functions can use data that is generally accessible, but do not make sense
- Possible to apply invalid functions to data
- No protection against semantic errors
- Data and functions are kept apart

C++ I Fall 2018 26 / 85

Disadvantages of Imperative Programming

► Lack of protection of data

Organization

- data is not protected
- transferred as parameters from function to function
- can be manipulated anywhere
- difficult to follow how changes affect other functions
- Lack of overview in large systems
 - huge collection of unordered functions
- Lack of source code reuse
 - difficult to find existing building blocks

C++ I Fall 2018 27 / 85

Cornerstones of OOP

Organization

- ► Data abstraction (hiding of information)
- ► Encapsulation (hiding of internal workings)
- ▶ Inheritance (relation between class and subclass)
- ► Polymorphism (ability to use the same syntax for objects of different types)

C++ I Fall 2018 28 / 85

Imperative Programming vs. OOP (2)

Organization

- ► OOP follows a bottom-up process
- ▶ Given a problem you should first ask yourself
 - ▶ Which are the entities which characterize this problem?
 - What are their characteristics? (member data)
 - ► How do they interact? (methods/functions)
 - Entities (objects) interact by mean of messages exchanged between them
 - ▶ A message is a request to execute a method

C++ I Fall 2018 29 / 85

OOP Allows Better Modeling

The OOP approach allows the programmer to think in terms of the problem rather than in terms of the underlying computational model

C++ I Fall 2018 30 / 85

OOP Characteristics (by Alan Kay, inventor of Smalltalk)

1. Everything is an object

Organization

- 2. A program is a collection of objects exchanging messages
- 3. Each object has a memory made by other objects
- 4. Every object has a type
- 5. Objects of the same type can receive the same messages

The Early History of Smalltalk, Alan C. Kay ACM SIGPLAN Notices Volume 28, No.

3, March 1993 Pages 69-95

http://stephane.ducasse.free.fr/FreeBooks/SmalltalkHistoryHOPL.pdf

Classes

C++ I Fall 2018 31 / 85

An Example: A Program for Printing the Grades of this Course

- ► Write a program which reads the names of the students and their grades, and then prints the list in some order (e.g., ascending order)
- ► Assumptions:

Organization

- ▶ Less than 100 students will attend this course
- ► For every student we log the complete name, the grade and the year of birth

C++ I Fall 2018 32 / 85

An Imperative (C like) Solution (1)

Organization

- ► Three so called aligned vectors, one of strings, one of floats, one of integers (name, grade, and year of birth)
- One function which fills the vectors and one function which sorts the elements (comparison based on the grade and consequent swap of all corresponding information)
 - ► Could also use a C struct to group all the data together

C++ I Fall 2018 33 / 85

Organization

18 }

A Classic Solution (2)

```
1 for (i = 0: i < Nstud: i++) {</pre>
    scanf("%s", names[i]);
    scanf("%f", &grades[i]);
5
  }
6 void sort(char** names, float*
       grades, int * years, int Nstud) {
    if (grade[j] < grade[k]) {</pre>
       /* swap elements */
       strcpy(tmpstr, name[j]);
10
       strcpy(name[j], name[k]);
       strcpy(name[k], tmpstr);
13
       tmpgrade = grade[j];
       grades[j] = grades[k];
14
       grades[k] = tmpgrade;
16
       . . .
```

Name	Grade	Year
XY	1.0	1978

900

34 / 85

C++IFall 2018

A Classic Solution (3)

Organization

26 }

```
struct student {
     char name [40];
     double grade;
     int year;
   };
   struct student S[100]:
   for (i = 0: i < Nstud: i++) {
10
     scanf("%s", S[i].name);
     scanf("%f", &S[i].grade);
12
13
   }
   void sort(struct student S*, int Nstud) {
16
     if (S[i].grade < S[k].grade) {
       /* swap elements */
18
       strcpy(tmpstr, S[j].name);
19
       strcpy(S[j].name, S[k].name);
20
       strcpy(S[k].name, tmpstr);
       tmpgrade = S[j].grade;
22
       S[i].grade = S[k].grade:
23
       S[k].grade = tmpgrade;
24
25
```

Name	Grade	Year
XY	1.0	1978

Classes

A Possible OO Solution

Organization

- Which are the entities?
 - Students
- ▶ What is their interesting data?
 - ► Name, grade, date of birth
- ▶ What kind of operations do we have on them?
 - ► Set the name/grade/date
 - Get the grade (to sort)
 - ▶ Print the student's data to screen
- ► Then: build a model for this entity and write a program which solves the problem by using it

C++ I Fall 2018 36 / 85

OOP Jargon

Organization

- ▶ You wish to model entities which populate your problem
- ► Such models are called classes
- Being a model, a class describes all the entities but itself it is not an entity
 - ► The class of cars (Car): every car has a color, a brand, an engine size, etc.
- ► Specific instances of a class are called objects
 - ▶ John's car is an instance of the class Car: it is red, its brand is XYZ, it has a 2.0 I engine
 - ► Mark's car is another instance of Car: it is blue, its brand is ZZZ, it has a 4.2 I engine

C++ I Fall 2018 37 / 85

Class Clients (or Users)

Organization

- ▶ We will often talk about class clients
- ▶ They are programmers using that class
 - ▶ It could be yourself, your staff mate, your company colleagues, or a third party which makes use of your developed libraries
 - Not the program user (to whom, whether the program is written in an OOP language or not, can be completely transparent)
- You develop a class and put it in a repository
- From that point, someone who uses it is a client

C++ I Fall 2018 38 / 85

Hello World (1)

```
#include <iostream>

int main(int argc, char** argv) {

std::cout << "Hello World!" << std::endl;

return 0;
}</pre>
```

< ロ > ← □

Hello World (2)

Organization

```
1 #include <iostream>
2
3 int main(int argc, char** argv) {
4   std::cout << "Hello World!" << std::endl;
5   // this is a one line comment
6   return 0;
7 }</pre>
```

- ► <iostream>: C++ preprocessor naming convention
- ▶ std::cout: used from the std namespace
- //: one line comments specific to C++ (but have found their way to C as well)

◆□▶ ◆周▶ ◆重▶ ◆■ ◆900

C++ I Fall 2018 40 / 85

The C++ Preprocessor

Organization

Runs before the compiler, works as the C preprocessor but:

- ► C++ standard header files have to be included omitting the extension
- ➤ The file iostream is then included as follows #include <iostream>
- C standard header files have to be included omitting the extension and inserting a c as first letter #include <cstdlib>
- Other files have to be included as in C
 #include <pthread.h>
 #include "myinclude.h"

C++ I Fall 2018 41 / 85

C++ Comments

Organization

► C++ allows to insert one-line comments and multi-line comments

```
// this text will be ignored
int a; // some words on a line
/* multi-line comment */
```

- ▶ Like in C, C++ comments are removed from the source by the preprocessor
- ▶ The programmer is free to use both styles

42 / 85

C++IFall 2018

cout: The First Object we Meet

Organization

- ► C++ provides some classes for dealing with I/O
- ► cout (console out) is an instance of the built-in ostream class, it is declared inside the iostream header
- ► The inserter operator << is used to send data to a stream cout << 3 + 5 << endl; // prints 8
- Inserter operators can be concatenated
- ► The end1 modifier writes an EOL (End Of Line)
- Data sent to cout will appear on the screen
- ► The stream cerr can be used to send data to the standard error stream (stdin, stdout, stderr in the C library)

C++ I Fall 2018 43 / 85

Operators with Different Meaning

Organization

- << has a different meaning in C</p>
- ► C++ allows the programmer to define how operators should behave when applied to user defined classes
 - ► This is called operator overloading (will be covered later)
 - In C, the << operator only allows to shift bits into integer variables

C++ I Fall 2018 44 / 85

Compile and Execute

Organization

- ► The g++ compiler provided by the GNU software foundation is one of the best available (and for free)
- Built on the top of gcc, its use is very similar
- ► C++ source files have extension
 - ▶ .cpp, .cxx, .cc or .C
 - ▶ self-written header files have the usual .h extension
- Adhere to these conventions
- ► Even if gcc would compile the files (it will recognize them as C++ source files by the extension), use g++ instead, as it will include the standard C++ libraries while linking

C++ I Fall 2018 45 /85

Compiling a C++ Program

- ► Compiling hello.cpp to an executable g++ -Wall -o hello hello.cpp
- ► Running the executable program ./hello

C++ I Fall 2018 46 / 85

cin : Console Input (1)

Organization

- ► cin is the companion stream of cout and provides a way to get input
 - ▶ as cout, it is declared in iostream
- ► The overloaded operator >> (extractor) gets data from the stream

```
float f;
cin >> f;
```

- ▶ Warning: it does not remove endlines
- If you are reading both numbers and strings you have to pay attention

ロー・4回・4 手・4 手・ 手 めなべ

Classes

C++ I Fall 2018 47 / 85

Boolean and String as Types

- bool as distinct type
 (also now in C, you need to include stdbool.h)
 bool c;
 c = true;
 cout << c << endl;</pre>
- string as distinct type
 string s;
 s = "Hello, I am a C++ string";
 cout << s << endl;</pre>

Organization

Classes

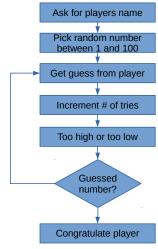

// convert to a C++ string

Organization

- ▶ There is one getline function and one getline method
- ► The function getline is a global function and reads a string from an input stream string str; getline(cin, str);
- ► The method getline gets a whole line of text (ended by '\n' and it removes the separator)
- It reads a C string (a character array that ends with a '\0')
 char buf[50];
 string s;
 cin.getline(buf, 50);
 s = string(buf);

C++ I Fall 2018 49 / 85

A Simple Guessing Game

C++ I Fall 2018 50 / 85

How to Pick a Random Number

Organization

```
1 #include <iostream>
2 #include <cstdlib>
3 #include <ctime>
  using namespace std;
  int main() {
    int die:
    int count = 0;
    int randomNumber:
9
    // init random number generator
    srand(static_cast < unsigned int > (time(0)));
11
    while (count < 10) {
       count++;
      randomNumber = rand():
       die = (randomNumber % 6) + 1;
14
      cout << count << ": " << die << endl:
15
    }
16
    return 0;
18 }
```

C++ I Fall 2018 51 / 85

C++ Extensions to C

- ► Inline functions
 - available in C since the standard C99
- Overloading
- ► Variables can be declared anywhere
 - ▶ possible in C since the standard C99
- References

C++ I Fall 2018 52 / 85

Inline Functions (1)

Organization

- ► For each call to a function you need to setup registers (setup stack), jump to new code, execute code in function and jump back
- ► To save execution time macros (i.e., #define) have often been used in C
- A preprocessor does basically string replacement
- Disadvantage: it is error prone, no type information
- ▶ inline.cpp

C++ I Fall 2018 53 / 85

Organization

```
int main() {
    int s;
    s = square(5);
    cout << s << endl;
    s = square(3);
    cout << s << endl;
}

int square(int a) {
    cout << "sq of " << a << end;
    return a * a;
}</pre>
```

```
int main() {
   int s;
   cout << "sq of " << 5 << end;
   s = 5 * 5;

   cout << s << endl;

   cout << "sq of " << 3 << end;
   s = 3 * 3;

   cout << s << endl;
}</pre>
```

Classes

C++ I Fall 2018 54 / 85

Function Overloading

```
1 #include <iostream>
2 using namespace std;
3 int division(int dividend, int divisor) {
    return dividend / divisor:
  }
5
6 float division(float dividend, float divisor) {
    return dividend / divisor:
  }
8
9 int main() {
10
    int ia = 10;
    int ib = 3:
  float fa = 10.0;
    float fb = 3.0;
13
14
    cout << division(ia, ib) << endl;</pre>
15
16
    cout << division(fa, fb) << endl;</pre>
    return 0:
17
18 }
```

Output: 3 3.33333

C++I

55 / 85

Fall 2018

Variable Declaration "Everywhere"

```
void function() {

void function() {

printf("C-statements...\n");

int x = 5;

// now allowed, works in C

// as well since standard C99
}
```

C++ I Fall 2018 56 / 85

No "Real" References in C (1)

Accessing a variable in C

```
▶ int a; // variable of type integer
```

- ▶ int b = 9; // initialized variable of type integer
- ▶ a = b; // assign one variable to another
- ▶ b = 5; // assignment of value to variable

C++ I

Organization

Classes

No "Real" References in C (2)

Organization

Accessing variable via pointers

```
▶ int a; // variable of type integer
```

```
▶ int b = 5; // initialized variable
```

```
▶ int* ptr; // pointer to integer
```

```
▶ *ptr = b; // assign b to content where ptr
// points to a is now 5
```

<ロ > < 回 > < 回 > < 巨 > くき > しま > しま の へ ○ ○

Classes

C++ I Fall 2018

References in C++

Organization

A reference can be seen as additional name or as an alias of the variable

```
▶ int a;
```

C++I

First Example

"Real" Call-by-Reference (1)

Introduction

```
1 #include <stdio.h>
void swap_cpp(int &a, int &b); // prototype
3 void swap_c(int *a, int *b); // prototype
4 void swap_wrong(int a, int b); // prototype
5 int main(void) {
    int a_cpp = 3, b_cpp = 5,
    a c = 3. b c = 5.
    a = 3, b = 5;
    swap_cpp(a_cpp, b_cpp);
9
    swap_c(&a_c, &b_c);
10
    swap_wrong(a, b);
11
    printf("C++: a=\%d, b=\%d\n", a_cpp, b_cpp);
12
    printf("C: a=\%d, b=\%d\n", a_c, b_c);
13
    printf("Wrong: a=\%d, b=\%d\n", a, b);
14
    return 0;
15
16 }
```

"Real" Call-by-Reference (2)

Organization

```
1 void swap_cpp(int &a, int &b) {
    // real Call-by-Reference
    int help = a;
    a = b;
    b = help;
6 }
7 void swap_c(int *a, int *b) {
8
    // not real Call-by-Reference
    // Call-by-Value via Pointer
    int help = *a;
10
  *a = *b:
12 *b = help;
13 }
14 void swap_wrong(int a, int b) {
    // Call-by-Value
15
    int help = a;  // no swapping of passed
16
17
    a = b:
                    // parameters,
    b = help;
                      // since only copies are swapped
18
19 }
```

Classes

C++ I Fall 2018 61 / 85

Constant References

Organization

- ▶ References are not only useful if arguments are to be modified
- ▶ No copying of (possibly large) data objects will happen
- Using references saves time
- ► To show that parameters are not going to be modified constant references should be used void writeout(const int &a, const int &b) { ... }
- ▶ ref_timing.cpp

C++ I Fall 2018 62 / 85

Dynamic Memory Allocation

C++ has an operator for dynamic memory allocation

- ▶ It replaces the use of the C malloc functions
- ▶ alloc_in_c.c

Organization

- Easier and safer
- ▶ The operator is called new
 - It can be applied both to user defined types (classes) and to native types
 - ► operator_new.cpp
 - use -std=c++0x switch to compile program according to the standard C++11
 - use -std=c++14 switch to compile program according to the standard C++14

C++ I Fall 2018 63 / 85

▶ new

Organization

- primitive types are initialized to 0
- returned type is a pointer to the allocated type
- delete releases allocated memory
 - delete ptr_1; // releases int
 - ▶ delete [] ptr_7; // releases int-array
- ▶ Memory that has been allocated via new [] must be released by delete []
- ▶ C: malloc() --> free()
- ightharpoonup C++: new --> delete

C++I

New Header Files

- stdlib.h or math.h can still be included in C++, but <cstdlib> or <cmath> is preferred
- ▶ Functions are then put into the std namespace
- ► Header files explicitly created for C++

C++ I Fall 2018 65 / 85

Namespaces

- ► C has only one global namespace
- ► Name collisions avoided by using prefixes
 - ▶ jpeg_xxx
- ► C++: using namespace std;
- ▶ Standard C++ libraries are all inside of the std namespace

C++I

Inline Functions

structs and classes

Introduction

OOP

```
int id;
3 float price;
4 };
5 int add_article(struct article*, int id, float price);
6 . . .
7 struct article a;
8 add_article(&a, 1234, 9.99);
1 class Article { // the C++ way
int id;
   float price;
   int add(float id, int price);
5 };
6 Article s:
7 s.add(1234, 9.99);
```

1 struct article { // the C way

◆母 > ◆ き > ◆ き * り へ ○

The string Class (1)

Organization

- ▶ string is another class provided by the standard C++ library
- ► It handles a sequence of characters which may dynamically grow or shrink
- Strings can be created in different ways

```
1 string empty;  // empty string
2 string a("this is also a string");
3 string b = "also this one";
4 empty = a;  // now they hold the same
5 empty += "8";  // appending to a string
```

Classes

C++ I Fall 2018 68 / 85

The string Class (2)

Organization

- ► The string class has many methods performing useful operations
 - ► Appending, inserting, removing, concatenating, replacing, searching, comparing and more
- ▶ We are not covering all of them on the slides
- ► See Chapter 5 in the *C++ Annotations* book or check operators and methods on www.cplusplus.com

OOP

C++ I Fall 2018 70 / 85

Deficiencies of C Structures

cstruct.c

Organization

- ► Any function is able to read and also write the variables one and two
- Uncontrolled access to the account
- ► Clients are able to directly manipulate data
- ▶ No guarantee that access is done in the "right way"

C++ I Fall 2018 71/85

struct in C++

Organization

Member functions, methods are part of the struct itself

```
struct account {
    char name[100];
    unsigned int no;
3
    double balance;
5
    // functions inside struct
    void createAccount(const char *name, ....);
7
    void deposit(double amount);
    void drawout(double amount);
    void transfer(struct account *to, double
10
     balance);
11 };
```

Classes

C++ I Fall 2018

How to Define New Classes

Organization

- ▶ The keyword class is used to define a new class
 - struct with methods
- ▶ Two other keywords used when defining classes:
 - private: to define what is internal to the class
 - public: to define what can be used from outside the class
- There exists a third keyword, protected, which will be introduced when we will talk about inheritance in more detail

C++ I Fall 2018 73 / 85

Information Hiding

Organization

- While designing a class it is necessary to devise which information should be visible and which one should not be visible to class users
 - ► This choice has to be done for both data members and methods
- ► The visible (public) subset of data and methods is called the interface of the class

C++ I Fall 2018 74 / 85

Information Hiding: Why?

▶ Protection:

Organization

- Users are not allowed to use class data not belonging to themselves (data integrity)
- ► Modularity:
 - An interface is a contract between the class developer and the class user
 - As long as the interface does not change, the private part of the class can be changed without the need to modify the code that uses that class

C++ I Fall 2018 75 / 85

private and public

Organization

- ► General rule: data should be kept private and methods should be provided to access (read and write) them
- There may be exceptions to this principle, mainly due to efficiency needs
- Methods providing functionality needed by class users will be public
- Methods used to implement these functionality should be private

C++ I Fall 2018 76 / 85

Critters

Organization

- ► Critter have several properties (name, color, hunger)
- Data concerning these properties will be kept private
- Methods should be provided to write those data (setter methods)
- ► A method to get data (e.g., name for sorting getter method)
- ▶ An additional method can be to print the data to the screen

C++ I Fall 2018 77 / 85

Implementation of the class Critter

- ▶ It is common to split the coding into two components
 - A header file specifies how the class looks like, i.e., its data members and methods
 - Class declaration
 - ▶ A C++ file defines how the methods are actually implemented
 - Class definition
- ► Critter.h

Organization

► Critter.cpp

C++ I Fall 2018 78 / 85

Organization

Critter.cpp can be compiled but:

- ▶ It is just a model (no instances up to now)
- ► No main function, so it is necessary to instruct the compiler to avoid the linking stage
- ▶ g++ -Wall -c Critter.cpp generates Critter.o

C++ I Fall 2018 79 / 85

Organization

- ▶ testcritter.cpp
- Putting all together:

```
g++ -c tescritter.cpp
g++ testcritter.o Critter.o -o testcritter
```

Could also be done by just one command:

```
g++ testcritter.cpp Critter.cpp -o testcritter
```

- Execute:
 - ./testcritter

C++I

Some Comments on testcritter.cpp

Organization

An instance of type Critter has been created

- ► Classes define Abstract Data Types (ADT)
- ▶ Once defined, they are types as language defined types, so it is possible to pass them as parameters to functions, declare pointers to ADT, etc.

Classes

C++ I Fall 2018 81/85

How to Invoke Methods

Organization

Public methods can be invoked by using the selection operator, which is a dot Critter c; c.setName("Gremlin");

```
Methods must be applied to instances and not to classes
Critter.setName("Gremlin"); // wrong!
```

- With the notable exception of static elements (to be covered later)
- Method invocation evokes procedure call

Classes

C++ I Fall 2018 82 / 85

How to Access Data Members

Organization

▶ With the selection operator it is also possible to access (read write) data members, provided they are accessible Critter c;

```
c.name = "Bitey";  // wrong: private
```

► Note the similarity with the selection operator used to access a C struct

C++ I Fall 2018 83 / 85

Specifying the Definition of a Class

Organization

Methods defined in the header file are usually implemented in a different source file

- ► Include the header (the compiler needs to know the shape of a class before checking methods)
- When defining a method specify the name of the class it belongs to:

```
void Critter::setName(string name) { ... }
```

► There can be more methods called setName in different classes, so it is necessary to specify which one it is being defined

C++ I Fall 2018 84 / 85

Defining a Method

Organization

When implementing a method it is not necessary to use the selection operator to call methods of the same class or to access data members

Access defaults to the local instance

```
void Critter::setName(string newname) {
name = newname;
}
```
